Sanna Marin, **To The Government of Finland,**

I understand that Finland, its government, own the company called Fortum which generates electric by the means of varies technics including trials by solar (photovoltaics) in India and I am positively sure, that The Finnish Government is interested in making a huge revenue-increase which would benefit both Finland, Europe and beyond the European border to Asia, South America, the African continent and Australia - just mentioning a few. Nordic countries are now installing power-cable running to England and sharing power is therefore already in the foundry which leads to the political non-sense of England not being part of Europe when the power which runs a whole country is shared between (European) nations of which Russia is a part (landmasses).

The Finnish Government through Fortum Julkinen osakeyhtiö <http://www.nasdaqomxnordic.com/aktier/microsite?languageId=1&Instrument=HEX24271> is delivering electric to other countries not by selling electric but by raking in tariff's and fees which are regulated by national and European Directives and the electric and power-supply market is a vast area of interest which is why it is in some cases nationalised.

A few days ago I was as blunt as to comment to Barry (getbarry.co) related to Barry receiving 500.000 new customers. An employee replied back in the new open minded free tone which is prevalent to Barry and I replied back with a response in which I foresee year 2050 and year 2100 delivering absolutely free at no cost electric power to all parts of society especially the private market at first since private users use electric to govern their lives by paying bills through Internet-banking and also shopping online at places such as alibaba.com where indeed very inexpensive solar-pannels can be purchased (it is unknown if nordic countries allow importing solar panels by the means of private purchase from countries such as Asia and/or if restrictions by the means of import-tax is laid upon private people wanting to promote free energy once the panels are installed (everything up until now shows that by using tariffs and taxes people are unable to do what the government say is best which begs the question why government can do what private can not)).

I am more than happy to outline the very simple idea which with Solar power is driving great forces from Dubai https://en.wikipedia.org/wiki/Mohammed_bin_Rashid_Al_Maktoum_Solar_Park to the rest of The World however at a very high cost for private users who have no idea where the money goes to with which they buy electric. I have uncovered parts of the market and corruption was and is probably still part of the tapestry and it makes one wonder why the nominal price of electric can rise approximately 1800% until reaching the consumer. The response I got from Barry was one of letting one of the largest opportunities go unforeseen unless had I not written to you promptly after receiving the negative reply today which only supports my notion, that there is something more going on than meets the eye - clearly - and I let your own imagination take part of the game and play at this point *)

China and USA are producing solar panels (the latter First Solar) and the way forward is sometimes not the most obvious which also begs the question; why is companies such as Barry admitting to not raking in money and revenue for external parties by being brokers/middlemen not charging for the electric at all. It would be same as if entering a bakery buying bread but not paying for the bread but for the bakery being able to invest revenue to build large bakery-powerplants - well - the allegory could be a different and better one but I am sure the Finnish Government gets the drift and please humour me back in return since this project is also driven by fun.

Therefore in short; is The Finnish Government not interested in a world-wide solution making energy 100% driven by solar and wind and so called green solutions making the cost near zero by the year 2015 alternatively 2100 and making sure electric is delivered at no cost what so ever to the end-user? If not, I will naturally promote the idea elsewhere with a very short time-span and I am positive a country building the tallest tower ever is interested far beyond letting a once-in-a-lifetime opportunity go adrift into interstellar space never to be heard of again.

Solarpanel Project Towards Free Power Year 2100

Well, the naming is not so important as long as a whole globe of people gets interested in buying electric from a source which will make electric free of charge as use consume with an end-goal 2100 making electric completely free for private users of which I estimate there by 2100 are perhaps 13 billion people (unless it goes the opposite way related to pandemics and such). Since, as I understand it, The Finnish Government owns getbarry.com and .co is the domain of Columbia one may wonder if national borders actually exist anymore for real even if some try to fence The World in by nations such as USA by building a ludicrous border-wall in times where even The Vatican City-(walls) travels far and near among others to Korea, Asia in general, and see borders as the biggest enemy of progress towards life, love and power by empowering people by buying energi which leads to freedom from having to enrich a small group of CEOs.

I will be more than happy to present the idea and will be able to in a short timespan to lay out the simpel details of Solarpanel Project Towards Free Power Year 2100 where I am positive that Finland is big enough to let China, UEA, Africa etc. be the frontrunners together with Europe, USA and beyond.

I await the reply from The Finnish Government within a short timespan - shall we say two days at the most. I am positively sure, that creating power-plants empowering people with free electric to pursue buying products online by year 2050 and year 2100 is not an idea one can miss. If I do not hear from The Finnish Government in the spirit of prosperity and hope of the best then I will naturally try elsewhere since the idea is already in the foundry in the future which Finland maybe wishes to part of.

All The Best From

Niels Ulrik Reinwald
Quality and Quantity United
